
Sona Framework Documentation

Release 1

Pokutnik Alexandr, Likhovidov levgenii

August 05, 2012

CONTENTS

1	What is Sona framework?	3
2	Indices and tables	5

Contents:

WHAT IS SONA FRAMEWORK?

Easy to use web layout framework based on LessCSS.

You can use it for:

- fast prototyping (use grids, collection of styles ...);
- in place handcrafted web design (change code, it immediately redraws in browser);
- as library full of helpful mixins (army knife for CSS);
- large layout projects with lot of code organized in modules with minimal code duplication;

If you are Designer with intention to handcraft your webpages you'll be exited:

- Highly customizable grid modules. Just define your vertical rhythm and grid size, number of columns, gap size. And you'll have a set of mixins for defining any block geometry to fit your grid.
- Setting base font size and max font size will create defaults for font settings to fit vertical rhythm and form beautiful geometrical progression for headings.
- Auto update feature will help you in *Inventing on Principle*. You don't need to reload web page to see changes you've made in CSS. (Currently you still need to reload a page after changes in HTML, but we are working on fixing it. Also Sona Framework differs a lot from classical layout frameworks to be more semantic, so usually you don't need to change HTML to change graphical presentation)
- Library greatly crafted ready to use building block like buttons, shadings etc.

INDICES AND TABLES

- *genindex*
- *modindex*
- *search*
